### PASSAGE 1 – Questions 1-10

It takes a long time to raise a family of owlets, so the great horned owl begins early in the year. In January and February, or as late as March in the North, the male calls to the female with a **resonant hoot**. The female is larger than the male. She sometimes reaches a body length of twenty-two to twenty-four inches, with a wingspread up to fifty inches. To impress her, the male does a strange courtship dance. He bows. He ruffles his feathers and hops around with an important air. He flutters from limb to limb and makes flying sorties into the air. Sometimes he returns with an offering of food. They share the repast, after which she joins the dance, hopping and bobbing about as though keeping time to the beat of an inner drum.

Owls are poor home builders. They prefer to nest in a large hollow in a tree or even to occupy the deserted nest of a hawk or crow. These structures are large and rough, built of sticks and bark and lined with leaves and feathers. Sometimes owls nest on a rocky ledge, or even on the bare ground.

The mother lays two or three round, dull white eggs. Then she stoically settles herself on the nest and spreads her feather skirts about her to protect her **precious charges** from snow and cold. It is five weeks before the first downy white owl pecks its way out of the shell. As the young birds feather out, **they** look like wise old men with their wide eyes and quizzical expressions. They clamor for food and keep the parents busy supplying mice, squirrels, rabbits, crayfish, and

beetles. Later in the season baby crows are taken. Migrating songsters, waterfowl, and game birds all fall prey to the hungry family. It is nearly ten weeks before fledglings leave the nest to search for their own food. The parent birds **weary of** family life by November and drive the young owls away to establish hunting ranges of their own.

**PASSAGE 2 -- Questions 11-20**

In the early 1800s, to reach the jump-off point for the West, a family from the East of the United States could either buy steamboat passage to Missouri for themselves, their wagons, and their livestock or - as happened more often- simply pile everything into a wagon, hitch up a team, and begin their overland trek right in their front yard.

Along the macadamized roads and turnpikes east of the Missouri River, travel was comparatively fast, camping easy, and supplies plentiful. Then, in one river town or another, the neophyte emigrants would pause to lay in provisions. For outfitting purposes, the town of Independence had been preeminent ever since 1827, but the rising

momentum of pioneer emigration had produced some rival jump-off points. Westport and Fort Leavenworth flourished a few miles upriver. St. Joseph had sprung up 55 miles to the northwest; in fact, emigrants who went to Missouri by riverboat could save four days on the trail by staying on the paddle-wheelers to St. Joe before striking overland.

At whatever jump-off point they chose, the emigrants studied guidebooks and directions, asked questions of others as green as themselves, and made their final decisions about outfitting. They had various, sometimes conflicting, options. For example, either pack animals or two-wheel carts or wagons could be used for the overland crossing. A family man usually chose the wagon. It was the costliest and slowest of the three, but it provided space and shelter for children and for a wife who likely as not was pregnant. Everybody knew that a top-heavy covered wagon might blow over in a prairie wind or be overturned by mountain rocks, that it might mire in river mud or sink to its hubs in desert sand - but maybe if those things happened on this trip, they would happen to someone else. Anyway, most pioneers, with their farm background, were used to wagons.

### PASSAGE 3 – Questions 21-30

Alexander the Great commissioned the city of Alexandria to create a Mediterranean stronghold in Egypt to rival Rome and cities in Greece. He died before his idea came to fruition, but his successors built it into one of the greatest cities of the Hellenistic world. The Royal Library of Alexandria has achieved an almost mythical status among scholars of classical studies. As with many ancient topics, scholarship on the matter often conflicts and relies heavily on hearsay and supposition. We will examine the importance of the library during its heyday and how it operated.

As with many ancient landmarks, there is much debate and controversy over Alexandria's library, especially regarding its destruction. The tale has been retold by countless historians and attributed to just as many different factions and rulers, not to profile this landmark of education, but as a tool for political slander. It is estimated that there are over 4000 writings regarding its destruction, yet very little data exists regarding the structure, layout, organization, administration, or whereabouts of the complex. The accuracy of the available information is suspect. However, 20<sup>th</sup> century scholars have reached some general consensus from the remaining sources.

Most historians have come to the conclusion that the original library (also known as the Temple of the Muses) was commissioned by Ptolemy I, Alexander's key general. More accurately, it was commissioned by the Athenian exile Demetrius of Phaleron under Ptolemy I's patronage. Traditionally it was attributed to his son Ptolemy II. However, it was later shown that Demetrius was antagonistic toward Ptolemy II and did not survive for much of his reign. Ptolemy II can be seen as responsible for the fruition and completion of the library and museum complex. H.G. Wells asserts that Ptolemy and his son encouraged 'a blaze of knowledge and discovery at Alexandria' through their funding of the library and other endowments.

The library itself was not a 'library' in the modern etymology. In fact, the library was essentially a collection of scholars and scribes encouraged to expand scientific and philosophical wisdom and musings brought about because of the ambition and drive of Ptolemy I. It was not the first institution of its type, developing about a half-century after Plato's Academy and Aristotle's Lyceum. About

30-50 scholars were probably permanently housed there, fed, and funded, first by the royal family, and later, according to an early Roman scroll, by public money. It served a religious, as well as an intellectual, function and it was the centerpiece of a so-called cult of the muses, governed by a priest.

[A] The library's output was created through observation and deduction in math, medicine, astronomy, and geometry, the editing of texts and manuscripts, and debating various advances in Western knowledge. [B] For two or three generations, the scientific output at Alexandria was considerably good. Its achievements included the introduction of the first steam engine, the first star map, and an astoundingly accurate estimate of the Earth's diameter. [C] Famous scholars employed there included Euclid, Eratosthenes, Apollonius, and Hero. [D]

The library may have consisted of a group of buildings, including lecture halls, study rooms, dining rooms, gardens, and an astronomical observatory. In organization of the library, it is believed that, in the time of Ptolemy II, the scrolls were haphazardly stored and grouped by general category. From the time of Callimachus onwards, they used an early iteration of a subject catalog. Subject divisions outlined by Callimachus included mathematics, medicine, astronomy, and geometry, as well as philology. At its peak, it is estimated about 600,000 scrolls were held within its walls, although that is likely an overstatement.

The Ptolemys achieved their goal of creating the largest collection of its kind by varied and often forceful means. At the time of its founding, Greek libraries were usually collections of manuscripts by private individuals. Ptolemy had a vision to collect all accepted literature on all matters scientific, philosophical and spiritual. The library tried to get copies of all known books and would send agents far and wide to acquire them. Ptolemy III wrote a letter "to all the world's sovereigns" asking to borrow their books. On more than a few occasions, scribes made copies and kept the originals. Supposedly, all ships entering Alexandria's harbor were searched for books to copy.

The Royal Library of Alexandria was created at an ideal time and place in world history. It was able to combine the deductive techniques of Greek thought toward the learning of other world cultures. As such, it holds a legendary position among historians as an

important center of classical knowledge. Although much of the story has been buried with time and conflict, the importance and significance of its contributions are clear.

#### PASSAGE 4 – Questions 31-40

The Pacific Ocean contains approximately 20,000 to 30,000 islands. Islands, excluding Australia, that are south of the Tropic of Cancer are grouped into three divisions: Melanesia, Micronesia, and Polynesia.

Melanesia includes the nation of Papua New Guinea, provinces of Indonesia, and the Solomon Islands. Micronesia means 'small islands,' most of which are north of the equator. Finally, Polynesia, which means 'many islands,' includes the Hawaiian Islands, Tonga, Tuvalu, and Easter Island, among others. Migrants from South East Asian cities were the first settlers. The next wave of migrants populated New Guinea, gradually spreading to Fiji. The last of the Pacific islands to be settled was Polynesia. Hawaii was discovered sometime between the 7th and 13th centuries.

Bats were the only mammals on these islands until the arrival of the first humans. Birds adapted to environmental niches, like grazers and insectivores. Due to the cool and humid location, New Zealand lost plants and animals, like the giant flightless bird, that were intolerant of its climate. However, the extinction coincided with the arrival of the Melanesians, so it was probably caused by hunting and

fires. Adding to that, mining and a natural drought destroyed a majority of the natural habitat. This was repeated on Easter Island, where early settlers wiped out 22 species of sea birds and land birds. By the time the Europeans had arrived, most of the plant life was extinct and nearly 30% of the forests were cleared.

The invasion of New Zealand by the Europeans resulted in a complete transformation of the island, importing over 3,198 species of plants and animals and filling most of the wetlands. Australia also imported animals and plants from many Pacific island countries. Sheep, pigs, goats and foxes were brought to Australia, which further disrupted the native ecosystems. Many plants and animals are presently endangered.

The plants and animals that inhabit Pacific islands are found nowhere else on earth. They are often adapted to specific habitats and live on a small part of a few islands. New Caledonia is an island that has been isolated from other lands for over 80 million years. 66 percent of the plant life there evolved on the island. Numerous plant species, unique in the world, are on a small area of one mountain and are represented by only a few specimens.

This varied genetic heritage is of such scientific importance that New Caledonia has been listed as one of the ten hot spots where the primary forest is in danger of extinction. It also boasts 68 species of bird; the most diverse bird life in the Southwest Pacific.

During the first Ice Age, ocean levels were much lower than they are at present. Levels in the shallow seas, now separating Asia from North America near the present-day Bering strait, dropped approximately 300 feet, creating 1,000 miles of grassland plain. Called the 'Bering Land Bridge,' this linked Asia and North America together. The Bering Sea has a long history of stable animal populations, despite the harsh environments, which sustain human life. Lemmings, ox, and mammoths all made the journey across the land bridge. Although mammoths have been extinct for quite a while now, the other two have remained.

Pacific walrus inhabit shallow waters of the Bering Sea during winter. They congregate to feed on clams, their principal food. [A] This type of feeding releases nutrients into the water, providing food for starfish and increasing the roughness of the sea floor. [B] Actual impact of the ecology of bottom communities is unknown, but

walrus, along with other animals like beavers and sea otters, have huge effects on the biological communities they occupy. [C] Animals such as seals, bowhead whales, and walrus are important for the subsistence of their community. [D]

Pacific islands have the same pollution and over fishing problems as most countries. Destructive forms of fishing in Asian nations have taken their toll on marine animals such as birds and tuna. Many of these nations have now entered joint venture agreements to enable them to develop their marine resources more efficiently.

### PASSAGE 1 – Questions 1-10

Scientists do not yet thoroughly understand just how the body of an individual becomes sensitive to a substance that is harmless or even wholesome for the average person. Milk, wheat, and eggs, for example, rank among the most healthful and widely used foods. Yet these foods can cause persons sensitive to them to suffer greatly. At first, the body of the individual is not harmed by coming into contact with the substance. After a varying interval of time, usually longer than a few weeks, the body becomes sensitive to it, and an allergy has begun to develop. Sometimes it's hard to figure out if you have a food allergy, since it can show up so many different ways. Your **symptoms** could be caused by many other problems. You may have rashes, hives, joint pains mimicking arthritis, headaches, irritability, or depression. The most common food allergies are to milk, eggs, seafood, wheat, nuts, seeds, chocolate, oranges, and tomatoes. Many of these allergies will not develop if these foods are not fed to an infant until her or his intestines mature at around seven months. Breast milk also tends to be protective. Migraines can be **set off** by foods containing tyramine, phenethylamine, monosodium glutamate, or sodium nitrate. Common foods which contain these are chocolate, aged cheeses, sour cream, red wine, pickled herring, chicken livers, avocados, ripe bananas, cured meats, many Oriental and prepared foods (read the labels!). Some people have been successful in treating their migraines with supplements of B-vitamins, particularly B6 and niacin. Children who are **hyperactive** may benefit from eliminating food additives,

especially colorings, and foods high in salicylates from their diets. A few of **these** are almonds, green peppers, peaches, tea, grapes. This is the diet made popular by Benjamin Feingold, who has written the book *Why Child is Hyperactive*. Other researchers have had mixed results when testing whether the diet is effective.

### PASSAGE 2 – Questions 11-20

Until recently, most American entrepreneurs were men. Discrimination against women in business, the demands of caring for families, and lack of business training had kept the number of women entrepreneurs small. Now, however, businesses owned by women account for more than \$40 billion in annual revenues, and this figure is likely to continue rising throughout the 1990s. As Carolyn Doppelt Gray, an official of the Small Business Administration, has noted, "The 1970s was the decade of women entering management, and the 1980s turned out to be the decade of the woman entrepreneur."

What are some of the factors behind this trend? For one thing, as

more women earn advanced degrees in business and enter the corporate world, they are finding obstacles. Women are still excluded from most executive suites. Charlotte Taylor, a management consultant, had noted, "In the 1970s women believed if they got an MBA and worked hard they could become chairman of the board. Now they've found out that isn't going to happen, so they go out on their own."

In the past, most women entrepreneurs worked in "women's" fields cosmetics and clothing, for example. But this is changing. Consider ASK Computer Systems, a \$22-million-a-year computer software business. It was founded in 1973 by Sandra Kurtzig, who was then a housewife with degrees in math and engineering. When Kurtzig founded the business, her first product was software that let weekly newspapers keep tabs on their newspaper carriers and her office was a bedroom at home, with a shoebox under the bed to hold the company's cash. After she succeeded with the newspaper software system, she hired several bright computer-science graduates to develop additional programs. When these were marketed and sold, ASK began to grow. It now has 200 employees, and Sandra Kurtzig owns \$66.9 million of stock.

Of course, many women who start their own businesses fail, just as men often do. They still face hurdles in the business world, especially problems in raising money; the banking and finance world, is still dominated by men, and old attitudes die hard. Most businesses owned by women are still quite small. But the situation is changing; there are likely to be many more Sandra Kurtzigs in the years ahead.

- A. Women today are better educated than in the past, making them more attractive to the business world.

### PASSAGE 3 – Questions 21-30

Symbiosis is a close ecological relationship between two dissimilar organisms. They assist each other with feeding, defending, and reproducing. In symbiosis, at least one of the pair benefits from the relationship. The other may be injured (parasitism), unaltered (commensalism), or may also benefit (mutualism).

An interesting mutually dependent relationship exists between the pine and the pinon jay. Blue pinon jays settle on the tops of pine trees and pick at the dark round seeds from the sticky cones. They store the seeds in their throats, fly off and hide them somewhere, and then return to repeat the process again. It seems the reproductive cycle of a pine jay **corresponds** with the ripening of the pine's seed. Similarly, the pine is dependent on the pinon jays for distribution of the seeds.

Seeds are stored in the bark of a tree or in the ground. Using their long bills, pinon jays plant and store them for later consumption. Their throats can expand to hold a large number of seeds; one pinon jay has been reported carrying 50 seeds in one trip. After they have planted

the seeds, they return to eat them. Using their bills like a woodpecker, they hammer the seed until the shell breaks. Any unrecovered nuts are then grown into new trees. This fascinating relationship has been ongoing for thousands of years.

When both species benefit each other, this is called mutualism. An example of mutualism is a plant and fungi. The fungus occupies the cortex cells of the secondary roots of the plant. This relationship is called a 'mycorrhiza.' It helps the plant absorb inorganic nitrogen and phosphorus from the soil. Some fungi also produce antibiotics which may prevent the invasion of parasitic fungi and bacteria. Another example of mutualism is pollination. Bees carry pollen from one plant to the next when they seek out plants for nectar. They feed themselves on the nectar, and the plants reproduce after fertilization by the pollen from other plants.

Mutualism can also bring together two very different organisms, for example, a buffalo and an ox bird. These birds journey on the backs of African buffalo eating their parasites. The bird receives food, and the buffalo is rid of irritating insects. There are also a number of fish that provide an excellent example of mutualism. Known as 'cleaner fish,' these fish get rid of parasites and dead skin found on other fish. The best-known example is the 'cleaner wrasse,' which dwells in the Pacific and Indian oceans. They clean large predatory fish by eating tissue and parasites off their skin. This relationship provides food and protection for the wrasse and several health benefits for the other fish.

The other two types of symbiosis, besides mutualism, are commensalism and parasitism. [A] Commensalism refers to a symbiotic relationship where one organism eats the unused food of another. [B] One benefits, but the other is not affected. Examples include the remora and the shark. The remora attaches itself to the shark, when the shark feeds itself, the remora picks up scraps. [C] One example of commensalism in humans is bacteria living in our intestines that feed on food in our gut. [D]

In parasitism, one organism benefits and the other is harmed. Parasites live off the body of other organisms and receive nourishment from their tissues, while also inflicting damage on their hosts. Plants are parasitized by bacteria, fungi, and a handful of other plants. Parasites cause harm by entering the tissue of the host for their own nutritional benefit.

None of these relationships are fixed, and it is likely that what starts as a parasitic relationship may gradually evolve into a mutualistic one. For example, in 1966, amebas were discovered that had become infected with bacteria. However, after five years, it was found that the core of the amebas had become dependent on the bacteria; thus, parasitism had evolved into mutualism. Unfortunately, the inverse is also possible; mutualistic associations may evolve into parasitic ones.

21. According to paragraph 2, what does the pinon jay do for the pine tree?

- A. It gives the tree important nutrition.
- B. It provides a primary means of seed dissemination for pinon trees.
- C. It keeps the tree free from parasites.

- B. includes
- C. exposes
- D. protects

23. According to paragraph 3, how does the blue pinon jay store the seeds for later?

**PASSAGE 4 – Questions 31-40**

Earth has several distinct layers; the outermost of these is the crust, which has an inconsistent thickness of 35-70 km in the continents and 5-10 km in the ocean basins. The second layer is known as the mantle, which is about 2900 km thick, and divided into an upper and lower mantle. Most of Earth's internal heat is situated here. The upper mantle has an area known as the low-velocity zone, where secondary waves decrease rapidly and then gradually increase. The last layer is the core. This is a thick ball of iron and nickel divided into two layers, the inner core and the outer core.

The inner core is solid, whereas the outer core is so hot that the metal is always molten. However, because the force at the inner core is so immense, it cannot melt. Due to Earth's rotation, the outer core spins around the inner core, which causes the Earth's magnetism. The inner core consists of iron, nickel and other elements, probably a mix of carbon, oxygen, sulphur, silicon, and potassium. The temperature is extremely high, and due to pressure, the core is solid. Because the outer core is liquid, mainly consisting of iron, nickel and about 10% oxygen and sulphur, here the temperature is not as high.

Both the outer and inner cores together create the Earth's magnetism. The core has a huge influence on Earth. Because it is so hot, it radiates a natural heat to the upper layers, setting off a current of heat, which in turn causes the movement of the tectonic plates. Because of Earth's rotation, the outer core spins, but the inner core does not because it is solid. This provides a sort of dynamo effect and causes the Earth's magnetic force.

A seismic wave is a wave that travels through Earth; it is often the result of a tectonic earthquake. There are two kinds of seismic waves, "body waves" and "surface waves." Other waves do exist, but

are of little importance. Body waves travel through the center of Earth, following ray paths which are bent by the unstable density and stiffness of Earth's interior. These differ according to temperature, **phase**, and structure. Body waves send out the first tremors of an earthquake as well as any later ones.

There are two kinds of body waves, "primary" and "secondary" waves. Primary waves are compression waves, meaning the ground is alternately compressed and expanded in the direction of propagation. These waves can travel slightly faster through solids than secondary waves can, and are also able to travel through any type of material. Through air, they take the form of sound waves and so travel at the speed of sound.

Primary waves, when created by an earthquake, are less destructive than sound waves due to their minor amplitudes. Secondary waves are tilted waves; in other words, the ground is shifted vertically in the direction of transmission. Here, the ground moves from one side to the other. Secondary waves are only able to travel through solids, not liquids or gases, and thus are unable to travel through Earth's core. Primary waves are faster than secondary waves. Primary and secondary waves are usually produced by earthquakes and volcanoes. However, they can also be produced by people using explosives or large machinery.

Surface waves are comparable to water waves traveling just under Earth's surface. They travel at slower speeds than body waves. Surface waves can be the most **devastating** type of seismic wave due to their low frequency, long duration, and large amplitude. In theory, they are understood as a system which relates to primary and secondary waves.

[A] **The moment an earthquake occurs, seismographs try to record its primary and secondary waves, but often they cannot detect the secondary waves of a distant earthquake.** [B] This may be due to the fact that secondary waves are unable to pass through liquids. [C] This information about wave travel helps scientists determine the internal structure of the planet. [D]

I'm back at work now, but it's a bit difficult to start again. I wish we were still on holiday.

Why don't we plan another trip this spring if you've got time and money? Any suggestions where we could go?

.....

Daisy

*Write a reply to Daisy. In your email, you have to tell her that you really like the photos and the time you got together, describe a problem you had at the airport to her and suggest the time and place for the next trip.*

You should write at least 120 words.

37. The word "devastating" in the passage is closest in meaning to \_\_\_\_\_.

- A. faint
- B. destructive
- C. productive
- D. quiet

38. Which of the following best expresses the essential information in the highlighted sentence? Incorrect answer choices change the meaning in important ways or leave out essential information.

- A. Although primary and secondary waves would be recorded, the secondary waves are not strong enough to be detected at a distance.
- B. Seismic waves are too small to be felt as a noticeable earthquake, but detectable by seismographs.
- C. Secondary waves can be generated as a result of nonlinear interaction, so seismographs cannot detect them.
